

Getting PHP Info for your site

There is a handy link under:

Site administration > Server > PHP Info

`/admin/phpinfo.php`

That will return the standard PHP Info `phpinfo()` results for your site.

Very handy for checking things like installed modules and core parameters if you are overriding them (e.g. `error_log`, `max_execution_time`, `post_max_size`, `upload_max_size`).

If you need to override any php options/values, be sure to check out the article on [Overriding PHP Settings](#) through `config.php`.
